GNSS receiver *(n)* ***(navig)*** GNSS Receivers are the core product for satellite positioning. They convert signals from visible satellites into a position on earth. The amount of visible satellites is dependent on the number of constellations the receiver is compatible with, such as GPS, Glonass, Galileo and Beidou. (https://geo-matching.com/gnss-receivers); GNSS receivers determine the user position, velocity, and precise time (PVT) by processing the signals broadcasted by satellites. Because the satellites are always in motion, the receiver has to continuously acquire and track the signals from the satellites in view, in order to compute an uninterrupted solution, as desired in most applications. Any navigation solution provided by a GNSS receiver is based on the computation of its distance to a set of satellites, by means of extracting the propagation time of the incoming signals travelling through space at the speed of light, according to the satellite and receiver local clocks. This time difference is transformed into a fake range, the "pseudorange", by multiplying it by the speed of the light in the vacuum, R=c×dt. The pseudorange might be seen as a very rough estimate of the true range between satellite and user, and

has to be corrected to account for a number of phenomena before it can be interpreted as a precise measurement of the true distance.

Hurricane Category 1: minmal damage, Hurricane Category 2; moderate damage, Hurricane Category 3 extensive damage, Hurricane Category:4: extreme damage,

Saffir-Simpson Hurricane Wind Scale			
Category	Wind Speeds		
	Miles (mph)	Kilometers (km/h)	Knots (kn)
FIVE	≥ 157 mph	≥ 252 km/h	≥ 137 kn
FOUR	130 to 156 mph	209 to 251 km/h	113 to 136 kn
THREE	111 to 129 mph	178 to 208 km/h	96 to 112 kn
TWO	96 to 110 mph	154-177 km/h	83 to 95 kn
ONE	74 to 95 mph	119 to 153 km/h	64 to 72 kn

* This scale only takes wind speed into consideration.
* Only used for hurricanes that form in the Atlantic Ocean & Northern Pacific Ocean.
* In 2012, the NHC expand the windspeed for category 4 by 1 mph in both directions.

These groundways run the length of the vessel and for some distance out under the water. On top of the groundways are placed the sliding ways, also heavy timbers, and between these two ways is placed a coating of launching grease. The sliding ways are prevented from sliding on the greased groundways by a trigger or similar device and dog or dagger shores. Cradles are built up to fit the form of the vessel, and between the sliding ways and the cradle, wedges are driven and the weight of the ship thus transferred from the building blocks to the sliding ways. After the building blocks and shores are removed, the trigger is released and gravity causes the vessel to slide down the inclined ways. In some cases hydraulic jacks are set at the upper end of the groundways to exert pressure on the sliding ways to assist in overcoming initial friction along the ways. (https://maritimereview.ph/what-is-mgo/); Marine gas oil (MGO) refers to marine fuels that consist solely of distillates, the components of crude oil that evaporate in fractional distillation and are then condensed from the gas phase into liquid fractions. It's similar to diesel but has a higher density and unlike heavy fuel oil (HFO), marine gas oil doesn't need heating during storage.

(https://www.speedyfuels.co.uk/guides/bunker-fuel-marine-oil-guide/) **brodsko plinsko ulje:**
MGO has inherently a transparent to light yellowish brownish color, but is colorized red. If a marine fuel like heating oil is used in inland waterway shipping, it is colorized with a yellow dye.
