a. Hand Spanner/Wrenches

There are different types of hand spanner and wrenches that are available in the work shop which could be selected depending on the type and condition of maintenance work to be done.

Example usage of hand spanner and wrenches:

i. Adjustable wrench is used as easy tool for undetermined size of bolt and nut when immediate tightening is required.
ii. Adjustable pipe wrench is suitable for fastening/loosening small sizes threaded pipes and damage head bolt in an awkward position.
ii. Slogging spanner is used for loosening and tightening big sizes of bolts using hammer.
iv. Instead of adjustable pipe wrench, hook spanner is used for threaded cap connection with teeth to avoid damaging the cap.
v. Offset spanners are used when working in an awkward position jobs.
vi. Square drive wrench is specially used for square bolts or handle.
vii. Torque wrenches are used for a specified torque controlled tightening of bolts and nuts.

{The tide is stemmed, alternately the wind, if it has stronger influence. In case the two are from slightly different directions, as shown, the weather anchor is let go with engines going dead slow ahead. The engines may be stopped as required, maintaining the headway. The anchor cable is continuously paid up to say 9 shackles (the total of the final shackle lengths). The vessel will tend to stop due to the springing back or slackening of cable. This will be also due wind and tide which were stemmed. Now, the lee anchor is let go and the cable paid out. The slack on the weather anchor cable is picked up as the vessel drops astern. The vessel may need astern propulsion to move astern. Once the vessel has reached the position, (half way between i.e. 4.5 shackles on each cable) the lee anchor becomes the riding cable. said to contain … (=STC) *(prep phr)* ***(mar law, logist)*** "1×20′ container Said To Contain 750 x 25 kg bags of Sugar". Suppose the container reaches destination and the receiver opens the container to find there are only 700 bags instead of 750 bags as per example below, natural instinct would be to hold the shipping line responsible just because they carried the cargo.. The cargo, the quantity and the weight inside the container are not known or verified by the shipping line (although the SOLAS VGM may be proof of the weight) because they are not involved in the packing of the container.. Therefore the shipping line needs some protection against potential claims relating to shortage etc, so they clause the bill of lading with Said To Contain..

(https://shippingandfreightresource.com/said-to-contain-clause-should-it-be-allowed-or-not/); This is a caveat clause applied to container-shipment transport documents, indicating that the carrier has no firsthand knowledge of what was loaded in the container.

sea bream (=seabream; sea-bream; sea bream) *(n)* **1** ***(fishing)*** **= gilt-head bream** English name for marine sparid fishes. The Sparidae family is also known as **porgies**. These fish have certain distinctive features that make them easily identifiable. First, their bodies are relatively flat. The line from the dorsal area to the front of the fish descends very rapidly giving the face a flattened appearance, especially when viewed in profile. Their color varies widely from species to species, mainly depending on water type and environment. In brackish waters, for example, the fish tend to be darker, with shades of blacks and grays to help them blend in with the environment. Some fish, in other areas, even have a bright red appearance, showing how diverse members of the family can be. ship design[1] **(=design)** *(n)* ***(nav arch)*** The ship design process may be broken down broadly into two stages: Conceptual and/or preliminary design and detailed or tender or contract design. The preliminary design process will normally take the form of a techno-economic appraisal, using a fundamental engineering economy approach. The ship owner's operational requirements need to be established during preliminary designing, which then allows the development of a basic specification such as deadweight, speed, range, capacity, stability, and freeboard. ship ownership 1 Under common law ship ownership includes both (a) legal and (b) equitable ownership. Ship ownership is based on legal title in property, i.e. the person who holds legal title is the owner of the property and has the right to exercise control over it. On the other hand, equitable ownership is based on fairness and good conscience. (https://www.handybulk.com/ship-ownership/); A British ship is conceptually divided in 64 units or shares as stipulated in Section 5 of the Merchat Shipping Act 1894. (https://www.handybulk.com/ship-ownership/#google_vignette); In principle, there are two primary categories of ship ownership namely, the ultimate owner and the beneficial owner. The former is usually the one who has legal title to the ship and may have financed the ship purchase. This owner is usually some form of financial corporation such as a bank. The latter is usually the entity who has the responsibility to control the commercial activities of the ship. (The Ownership and Nationality of a Ship from a Maritime Cabotage Law Perspective) (eprints.bournemouth.ac.uk) **vlasništvo nad brodom** **types of ship ownership** two or more individials (or corporation) share ownership of a vessel **vrste vlasništva nad brodom** **Individual ownership** **jedan brod - jedan vlasnik (fizička ili pravna osoba),** **Co-ownership** **suvlasništvo** **Joint Owners (Joint Tenants; Joint Tenancy))** **suvlasništvo (u zajedničkom pothvatu),** **Tenants in Common (part owners)** **djelomično suvlasništvo;** 2 All ships must of essence have an owner and a nationality with which they are identified with. stability change (=change in stability) *(n)* ***(stabil, nav arch)*** **promjena stabiliteta broda:** *The metacentric height of the ship changes due to flooding. This can be explained by the general expression of metacentric height: GM = KB + BM - KG. The explanation of reduction in stability can be done in two ways, which is exactly what we will study in this article, but at a later stage. For now, it should suffice to understand that when a ship is flooded, it results in a change of KB and BM values. The KB rises due to flooding, and it may rise further due to change in the ship's trim. However, there is a significant reduction in BM, which is a function of the area moment of the ship's water plane. Why? We will look into that when we study the Lost Buoyancy Analysis.* https://www.marineinsight.com/naval-architecture/ship-stability-damaged-stability-ships/ **{GM = metacentric height; KB = Centre of Buoyancy; BM = Metacentric Radius = distance from the keel to the metacentre = distance from the vessels center buoyancy to the keel; KG = Centre of Gravity}**

Corrections or changes to an original bill of lading calls for issuing another set with the correct details on it by way of a switch bill of lading. While some very minor alterations are endorsed on the original bill of lading itself, there may be other changes that require the issuance of a fresh set. These include changes to the port of discharge, the buyer or receiver, the description of goods to include its full details or certain specifications, or the trading terms. Any of these pre-agreed points may have changed while the goods are in transit. When any of these cases occur a fress bill of lading is issued and therefore called a ***switch bill of lading***.

(http://www.clarksons.com/glossary/); Worldscale is a nominal worldwide tanker scale used to establish payment of freight services; Nominal freight scale applying to the carriage of oil and oil products in bulk by sea. An international freight index for tankers that provides a method of calculating the freight applicable to transporting oil by reference to a Standard Vessel on a round trip voyage from one or several load ports to one or several discharge ports. Worldscale*:** *The flat rate point 100 is effectively the breakeven point in accordance with the basis of calculation for the **Worldscale** Standard vessel but not for any other size. **Worldscale** iIncludes expenses associated with ports, transit fees, port and voyage time and vessel bunker costs assessed in relation to the Worldscale Standard Vessel basis of calculation in order to produce a comparative nominal freight scale reported in dollars per tonne. Worldscale is used to calculate freight rates for oil tankers and product carriers. It is a tanker chartering tool, its principle is to provide the ship-owner with the same net return per day irrespective of voyage performed for the Worldscale Standard Vessel at WS100.* **Worldscale rates vozarinski stavovi izračunani prema tablici Worldscale:** ***Worldscale Rates *are based upon a 75,000 tonne total capacity vessel performing a round voyage and expressed in dollars per tonne of cargo. Any new **Worldscale rate** request will require mileage calculations, any voyage costs and port cost information. Rate calculations may involve several different route options to determine the cheapest. The final rate agreed will be determined as a percentage of the '**Worldscale' rate**, based upon a guaranteed minimum quantity of cargo. This allows for charter parties to cover a wide range of possible voyage options without the need to calculate and negotiate each one separately.* www.euronav.com
